

BELTS, FABRICS, AND TAPES

Technicor can now supply a variety of coated belts, fabrics, and tapes. These products are often used in applications that require high-temperature resistance and non-stick properties including the Packaging and Food Industries.

Typical construction consists of a woven fiberglass or Kevlar cloth substrate coated with either PTFE or

Silicone yielding a stable, strong and tear resistant fabric.

Their low coefficient of friction makes them very slick with excellent release properties. As well, they have excellent chemical resistance and a wide temperature range: from -100°F to +500°F.

Tapes with adhesive backings make them easy to apply.

Call us for more detailed product information and application assistance on your plastic needs.
